

I, for one, would not like to tell the manufacturer's how to make their equipment. I feel that they do quite a nice job now. On Mr. Leggett's comments that it would enhance emergency communications--is one to think that an individual would have a replaceable printed circuit board for all the circuits in the radio. Why not just be another radio for standby? I think it would be less expensive. The comment about the "growth of technical knowledge"...I don't believe that plugging in a replacement board would add much to one's knowldege. I respectfully request you to deny this petition, as I feel it would be a hardship on not only the manufactuer's but the ham community. Let Mr. Leggett design and sell his own line of radios. Thank you.
